

Chapter 33 Lenses and Optical Instruments

PHYS-102

Conceptual Questions

1. Where must the film be placed if a camera lens is to make a sharp image of an object far away?
3. Can a diverging lens form a real image under any circumstances? Explain.
8. Compare the mirror equation with the thin lens equation. Discuss similarities and differences, especially the sign conventions for the quantities involved.
14. The thicker a double convex lens is in the center as compared to its edges, the shorter its focal length for a given lens diameter. Explain.
19. You can tell whether people are nearsighted or farsighted by looking at the width of their face through their glasses. If a person's face appears narrower through the glasses, is the person farsighted or nearsighted?

20. The human eye is much like a camera - yet, when a camera shutter is left open and the camera is moved, the image will be blurred. But when you move your head with your eyes open, you still see clearly. Explain.
26. For both converging and diverging lenses discuss how the focal length from red light differs from that for violet light

Problems

33-1 and 33-2 Thin Lenses

1. A sharp image is located 373 mm behind a 215 mm focal length converging lens. Find the object distance (a) using a ray diagram, (b) by calculation.
2. Sunlight is observed to focus at a point 18.5 cm behind a lens, (a) What kind of lens is it? (b) What is its power in diopters?
4. A certain lens focuses an object 1.85 m away as an image 48.3 cm on the other side of the lens. What type of lens is it, and what is its focal length? Is the image real or virtual?
6. A stamp collector uses a converging lens with focal length 28 cm to view a stamp 18 cm in front of the lens. (a) Where is the image located? (b) What is the magnification?
10. (a) How far from a 50.0 mm focal length lens must an object be placed if its image is to be magnified 2.50X and be real? (b) What if the image is to be virtual and magnified 2.50X?
12. (a) A 2.80 cm-high insect is 1.30 m from a 135 mm focal length lens. Where is the image, how high is it, and what type is it? (b) What if $f = -135$ mm?
13. A bright object and a viewing screen are separated by a distance of 86.0 cm. At what location(s) between the object and the screen should a lens of focal length 16.0 cm be placed in order to produce a sharp image on the screen? [Hint, first draw a diagram.]
14. How far apart are an object and an image formed by an 85 cm focal length converging lens if the image is 2.95X larger than the object and is real?

33-3 Lens Combinations

20. A diverging lens with $f = 33.5$ cm is placed 14.0 cm behind a converging lens with $f = 20.0$ cm. Where will an object at infinity be focused?

21. Two 25.0 cm focal length converging lenses are placed 16.5 cm apart. An object is placed 35.0 cm in front of one lens. Where will the final image formed by the second lens be located? What is the total magnification?

26. A diverging lens is placed next to a converging lens of focal length f_C , as in Fig. 33 15. If f_T represents the focal length of the combination, show that the focal length of the diverging lens, f_D , is given by

$$\frac{1}{f_D} = \frac{1}{f_T} - \frac{1}{f_C}$$

27. A lighted candle is placed 36 cm in front of a converging lens of focal length $f_1 = 13$ cm, which in turn is 56 cm in front of another converging lens of focal length $f_2 = 16$ cm. (a) Draw a ray diagram and estimate the location and the relative size of the final image. (b) Calculate the position and relative size of the final image.

33-4 Lensmaker's Equation

28. A double concave lens has surface radii of 33.4 cm and 28.8 cm. What is the focal length if $n = 1.58$
29. Both surfaces of a double convex lens have radii of 31.4 cm. If the focal length is 28.9 cm, what is the index of refraction of the lens material?
33. A prescription for a corrective lens calls for +3.50 diopters. The lensmaker grinds the lens from a “blank” with $n = 1.56$ and convex front surface of radius of curvature of 30.0 cm. What should be the radius of curvature of the other surface?

33-6 Eye and Corrective Lenses

41. A person struggles to read by holding a book at arm's length, a distance of 55 cm away. What power of reading glasses should be prescribed for her, assuming they will be placed 2.0 cm from the eye, and she wants to read at the "normal" near point of 25 cm?

42. Reading glasses of what power are needed for a person whose near point is 105 cm, so that he can read a computer screen at 55 cm? Assume a lens-eye distance of 1.8 cm.

45. A person's right eye can see objects clearly only if they are between 25 cm and 78 cm away, (a) What power of contact lens is required so that objects far away are sharp? (b) What will be the near point with the lens in place?

46. A person has a far point of 14 cm. What power glasses would correct this vision if the glasses were placed 2.0 cm from the eye? What power contact lenses, placed on the eye, would the person need?

48. What is the focal length of the eye lens system when viewing an object (a) at infinity, and (b) 38 cm from the eye? Assume that the lens retina distance is 2.0 cm.

33-8 Telescopes

60. What is the magnification of an astronomical telescope whose objective lens has a focal length of 78 cm, and whose eyepiece has a focal length of 2.8 cm? What is the overall length of the telescope when adjusted for a relaxed eye?

63. An astronomical telescope has an objective with focal length 75 cm and a +35 D eyepiece. What is the total magnification?

General Problems

87. A small object is 25.0 cm from a diverging lens. A converging lens with a focal length of 12.0 cm is 30.0 cm to the right of the diverging lens. The two lens system forms a real inverted image 17.0 cm to the right of the converging lens. What is the focal length of the diverging lens?
